Using softer elastomer for the part that fixes fan cover, the vibration of housing is reduced

Achieved by redesigning the exhaust air flow path of the motor to reduce wind noise.

Noise absorbing sponge

New cyclone unit

Filter clogging is suppressed by separating fine dust particles from the air with centrifugal force in the cyclone unit. Thus, the decrease in suction power of the cleaner is minimized.

The amount of dust that can be sucked until filter needs to be cleaned is about 6 times of dust amount suctioned without cyclone unit.

For increased cleaning efficiency, the integrated cyclone unit is positioned above the extension pipe so that it does not hit the floor or surrounding objects when cleaning narrow spaces such as the floor under racks or sofas.

4-mode suction power selection with mode memory function

- The cleaner can memorize a previous power mode and resume vacuuming at the same mode as last time user turned off for user convenience.
- Power mode can be selected before the cleaner is turned on.
- Selected power mode is indicated by 4 green LEDs.

Redesigned Floor/ Carpet T-nozzle

- Redesigned structure reduces the resistance caused by suction, providing smooth running.
- Redesigned inside air flow path reduces the noise made inside the nozzle.

Easy filter setting

Filter can be fixed with a single push.

Pipe locking mechanism

Pipe is fixed with the locking mechanism to prevent it from accidentally coming off.

Single LED job light

also functions as a battery capacity warning lamp.

Pipe with beveled end

Cleaning of tight places can be done without nozzle by using the beveled end of pipe as a nozzle.
